Pöttinger BOSS junior / BOSS L T

Self-loading wagons with
feeding tines

PÖTTINGER

Getting your forage in quickly and extremely

It's harvest time, and even on smaller farms it's important to ensure the best-quality forage. High forage quality saves having to use expensive concentrates and delivers a higher yield.

It's good to know that you're making further savings as the self-loading wagon is indisputably the lowest-cost forage-harvesting system available.

The pick-up systems are particularly kind to the forage, and the well-engineered chopping units simplify operations.

Smooth running, operating efficiency and versatility are also features of the smaller Pöttinger self-loading wagons.

What other manufacturer can offer you this wide range of features?

... working for your success

You can count on Pöttinger for the future

Farmers are under pressure to keep costs down and therefore demand technology that enables them to reduce their costs significantly. Soil and forage protection are fundamental principles of sustainable agriculture that determine yields and therefore also business profits. Technology – combined with advanced electronics – will bring about fundamental changes to many operations in agriculture in the future. Pöttinger is focusing on cost-effective and intelligent agricultural engineering with particular reference to forage and soil protection

We firmly believe that this concept will align itself with development trends in the next few years. You can count on Pöttinger for the future.

Pöttinger is more than engineering. Behind each machine stands a highly qualified team, an effective customer-service organisation and a global service network.

In short – clever farming.

Machine durability

Bigger machines pulled by ever faster tractors place huge demands on the strength of the machine. New testing facilities enable weaknesses to be identified and corrected. In the case of the 4-piston test rig for machines of up to 25 tonnes the machines to be tested are placed on cylinders and made to vibrate vertically. This rig makes it possible to test complete machines. A range of tests can be carried out, from investigations into the strength and robustness of the headstock construction, to checking the attachment of individual components, through to operational comfort tests. This means that only technically mature products reach the market, and “teething troubles” are dealt with at the development stage.

Up close and personal

Downtime is costly and exasperating. Our sales partners can supply spares quickly. Perfect documentation of all "Original inside" parts reduces waiting times.

Trained sales partners respond immediately to our customers' needs. You're never far from a Pöttinger sales partner.

Original *inside*

Only "Original inside" parts guarantee quality and top performance at harvest time.

How you benefit:

- Low wear
- Long service life
- Extremely resistant to damage
- Precision fit
- Long-term availability
- Excellent performance

Always well informed ...

Design

Unloading

The hydraulic scraper floor ensures rapid, smooth and quiet unloading – without engaging the pto shaft.

The tailgate is in the form of a swing-to tailgate which can be

opened from the cab via a control cable.
A hydraulic control system is available on request for optimum convenience.

Lightweight design with key benefits

BOSS junior and BOSS L are modern, lightweight self-loading wagons featuring performance, reliability and comfort.

The **BOSS junior 17** is a low-loader model with a capacity of $18 \text{ m}^3 / 635.6 \text{ feet}^3$, suitable for operation on slopes.

$22 \text{ m}^3 / 777 \text{ feet}^3$ of capacity is offered by the **BOSS junior 22**, which is available as a high or low-loader model.

Both have a modern 12-knife chopping unit.

The **BOSS L** low-loaders with capacities of $22 \text{ m}^3 / 777 \text{ feet}^3$ or $28 \text{ m}^3 / 989 \text{ feet}^3$ can be used anywhere.

Both can be fitted with up to 16 knives.

Body

The robust steel-section frame can withstand very harsh conditions. A robust chassis with wide tyres and a braked axle provides adequate stability when operating on slopes.

The strong metal walls are galvanised and plastic-coated. The special coating enables the forage to be unloaded smoothly and trouble-free.

The dry forage extension is spring-loaded and therefore easily operated. A hydraulic operating mechanism is available on request for the **BOSS L**. A number of tautly tensioned roof ropes ensure that no forage is lost.

Drawbar variants

Height-adjustable drawbar

The drawbar can be infinitely adapted to any tractor by means of spindles. A low-slung drawbar is also possible where specific national regulations require this.

A retractable **jockey wheel** adds extra clearance when driving over large swaths.

On the **BOSS L** the jockey wheel is mounted on the frame and can be pivoted up out of the way.

The optional **hydraulic pivoting drawbar** guarantees sufficient ground clearance on clamps. An automatic lock prevents unwanted movement at the pivot.

The **BOSS L** pivoting drawbar is fitted with two hydraulic cylinders.

Ground clearance of $60 \text{ cm} / 23.62''$ under the pickup guarantees unobstructed driving on clamps and over undulating ground.

Pickup

Perfect ground-following

The pickup cam track with its solid inner core is made of high-quality steel – not a casting. An inspection cover for rapid checking of the rollers and cam track comes as standard.

The cam rollers, consisting of sealed-for-life deep-groove ball bearings, are sturdy and designed for heavy use.

Tandem jockey wheels are also available on request for the BOSS L for use on extremely uneven ground.

Transfer plates from the pickup to the loading system allow dirt and stones to drop through, resulting in less contamination of the forage and thus reducing potential damage to the knives.

nothing is left behind ...

The pickup, which has proved itself over many years of operation, gets a straight "A" rating.

The spring-loading system and accurate adaptation to uneven ground guarantee pickup of the forage with clean raking pickup tines.

Loading performance needs a clean start

The 15x6.00-6 pickup jockey wheels ① with 8 position settings follow the ground on exactly the same line as the pickup tines.

The pickup's optimum torsion properties and strong spring-loading system ② enable it to adapt to uneven ground.

Outwardly curving pickup side baffles route all the crop into the conveyor duct. The height-adjustable windguard ③ ensures clean pickup with short-chopped forage.

Hydraulic lifting is achieved via two laterally mounted lift cylinders ④.

The pickup tines are swept back,

this protects the tines as they follow the ground, which in turn prevents damage to the sward, ensuring nothing is left behind.

The pickup drive is located at the side and is delivered via a heavy-duty chain drive. A freewheel clutch protects the tines when reversing.

The conveyor unit can be turned manually, e.g. for maintenance work, at the drive gear using the lever supplied.

BOSS junior:	1.55 m / 5.1' pickup width	4 rows of tines
BOSS LT:	1.65 m / 5.4' pickup width	5 rows of tines

SUPERMATIC

Users' verdicts

"The chop length of 12 cm / 4.7" is perfectly adequate for our clamp since

we use very little of the first cut for making silage but all of the third cut when the forage isn't very long anyway."

Johann Mittenwallner / Altenmarkt, Salzburg

"We use the wagon for silage-making on our own farm, and cutting with 16 knives is fine for that. It's also used in hay on a second farm to ensure better capacity utilisation."

Stefan Luftenstein / Ampass, Tyrol

... the low-drag energy-saving system

Centrally split feeder-tine banks result in a measurable reduction in drag: separate gathering and staggered cutting mean there are no load peaks even when all the knives are in operation.

BOSS junior and BOSS L

Three split feeder-tine banks and a cam track-control system on both sides – resulting in a six-phase conveying and cutting sequence – are the key of this system.

As a result of the central splitting and off-set mounting of the feeder-tine banks, the load is distributed to the cam rollers and cam tracks on both sides.

The wide conveyor duct protects the forage and guarantees extremely high loading performance. Each knife cuts the forage exactly between the dual tines. The forage is always cut cleanly rather than torn off.

The circular cam tracks ensure smooth, jolt-free loading, which protects the forage and guarantees a long service life. The feeder tines are precisely tracked in each phase.

Each feeder-tine bank is mounted in hardened rolling bushes.

Transmission

The drive to the loading system is provided by a heavy-duty chain. The pickup and loading system are fitted with an automatic transmission and reverse-rotation unit. A wide-angle pto shaft is supplied as standard.

Chopping unit

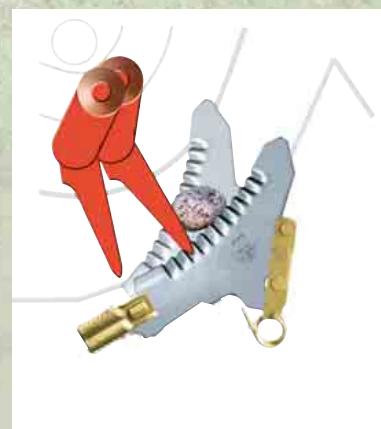

BOSS L 28 T

BOSS junior 17 T

Proven knife-protection system:

If a foreign body triggers the protection system, the knife is deflected to the rear by up to 13 cm / 5.12" with minimal resistance and then automatically springs back into position. The triggering force remains the same, regardless of where the foreign body strikes the knife.

... for performance-oriented feeding

Precisely uniform cutting is the basis of good forage quality. This guarantees better feed utilisation by the animals, less reliance on concentrates, and higher milk yields.

Forced cut

The forage is always held on both sides by the dual tines as it is offered up to the knives, thereby guaranteeing a clean cut – even with wet, heavy forage.

Chop quality:

BOSS Junior	4 knives (standard), maximum 12 knives	Knife spacing 120 mm/4.7"
BOSS LT	4 knives (standard), maximum 16 knives	Knife spacing 84 mm/3.31"

Knife maintenance made easy

High-loader model: The knives can be removed or fitted quickly and easily:

1. Undo bolt mechanism.
2. Fold back or remove quick-release knife bank.

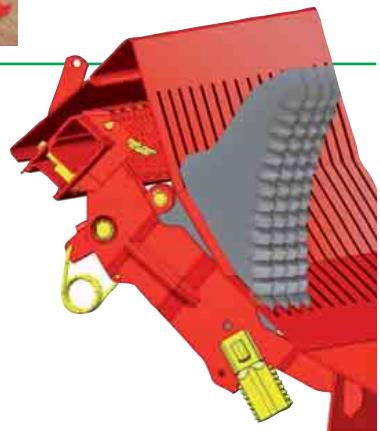

In the low-loader models this can be carried out from the loading chamber:

1. Raise cover.
2. Unlock knife.
3. Move knife to rear or remove.

The original with the serrated blade

The knives are made of hardened tool-quality steel. Extended knife design ensures a trailing cutting action. The serration on one side ensures a precise cut even if the knife edge is blunt. The forage is always cut rather than torn off.

Every driver deserves to be comfortable

Pöttinger is committed to easy operation.

BOSS L 22 T

Cab operation with preset actuation ①

The pickup and scraper floor are operated hydraulically from the cab. The enhanced-feature system enables the hinged drawbar, tailgate and dry forage extension (BOSS L) to be hydraulically operated. This requires a double-acting connection or a single-acting connection with oil return.

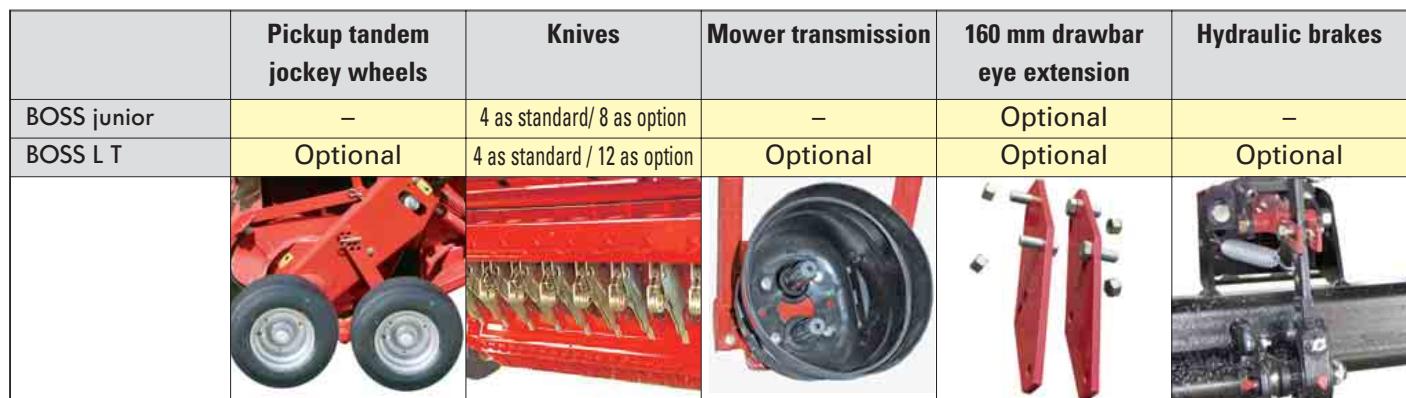

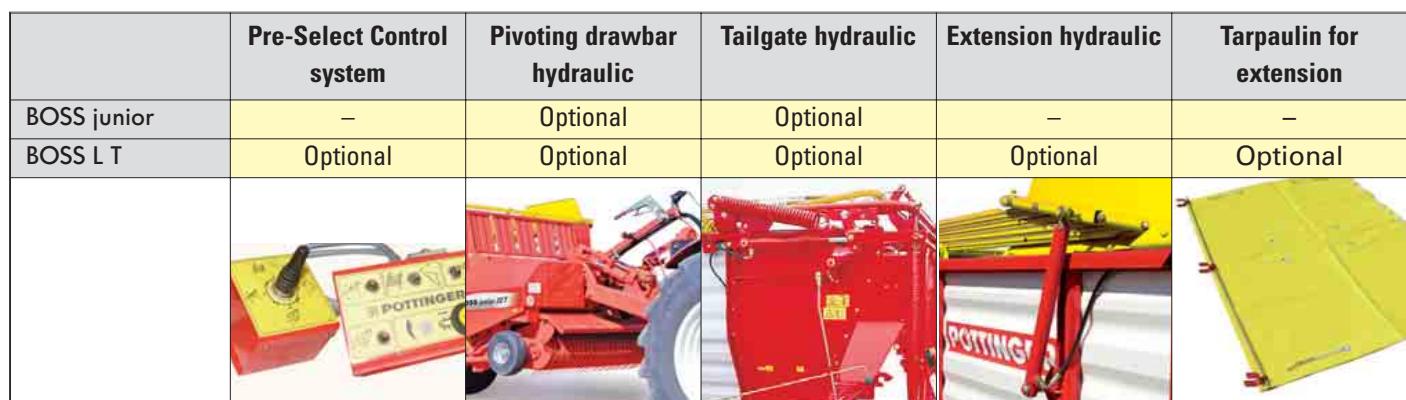

Electrohydraulic operation ②

Extra convenience is provided by the optional **Pre Select Control** system in the BOSS L T. Electrohydraulic preset operations for all functions – no more hydraulic hoses in the cab – just a single-acting connection is required.

Scraper floor operation via a single-acting connection with oil return or an electric scraper floor preset.

Electrohydraulic Comfort Operation ③ as an option in the BOSS L T.
